Test Summary Report

Recorded release evidence and remaining acceptance

Group 1

MIT 820 Software Development Project I

Group member	Registration number
Aminu Idris	2630802400002
Saidu Mustapha Suleman	2630802400001
Bolaji Watson	2630802400009
John Ojuekaiye Mayowa	2630802400008
Egbue Odira Celestine	2630803400003

Document version 1.1 Application baseline 1.0.4 23 October 2026

Final presentation 28 November 2026
Portal submission 29 November 2026 before 11:59 p.m. WAT

1 Scope and result

This report summarises the machine-readable acceptance evidence retained for CivicFlow 1.0.4. The files record 267 passed assertions across five suites. Most timestamped suites ran on 19 October 2026. The documentation revision date is 23 October 2026 and does not represent a new execution date for those results.

An assertion count describes the checks exercised under the recorded conditions. It is not a count of citizens, an independent penetration test, a workload benchmark or proof that every possible failure has been covered.

Suite	Pass	Total	Recorded date	Scope
Workflow and security HTTP	124	124	19 October 2026	SQLite and loopback PHP server
Fresh installation HTTP	13	13	19 October 2026	SQLite live installation defaults
Installer regression	5	5	19 October 2026	Storage and database error handling
Landing and role dataset	113	113	19 October 2026	Landing, 26 accounts, 36 cases and access rules
Carousel interaction fixture	12	12	Recorded release evidence	JavaScript fixture, not a rendered browser test
Total recorded assertions	267	267	Release 1.0.4 evidence	Assertion count, not users or complete security coverage

2 Environment and evidence provenance

The workflow and fresh-installation suites use a disposable application copy, a PHP loopback HTTP server and SQLite. The recorded workflow runtime is PHP 8.3.6. Test accounts and harmless documents remain confined to that temporary environment. The harness checks both the HTTP response and persisted state.

Native MariaDB schema and representative-query checks and Apache directive syntax checks remain separate compatibility evidence. They do not establish a full hosted HTTP/PDO-MySQL run. The carousel report explicitly records browser_rendering_test as false. The supplied JSON files retain individual check names and results.

Evidence file	Checks
acceptance-sqlite.json	124 workflow and security assertions
acceptance-live.json	13 fresh-installation assertions
acceptance-installer.json	5 installer regression assertions
acceptance-landing-demo.json	113 landing and prepared-record assertions
acceptance-carousel.json	12 JavaScript interaction-fixture assertions

3 Method and representative outcomes

Successful scenarios cover citizen registration, complaints, permits, review, requests for information, replies, decisions, tracking and feedback. Negative cases cover forged registration roles, other-owner access, unrelated departments, internal documents, MIME spoofing, invalid transitions, stale updates and token replay.

The outbox scenarios verify held configuration states, cancellation, escaped templates, controlled SMTP connection refusal, retry backoff and the five-failure stop. No real message receipt is inferred from a refused local connection.

The dataset scenarios verify additive loading, reserved contact addresses, unchanged existing accounts and records, all role boundaries and idempotency. The slider fixture checks script state and controls. A manual browser and accessibility evaluation is still required.

4 Release corrections

Version 1.0.1 retained runtime subdirectories in the extracted archive and aligned password input with the 72-byte hashing boundary. Version 1.0.2 improved storage readiness and database diagnostics. Versions 1.0.3 and 1.0.4 added the public landing experience and controlled evaluation records and adjusted the public presentation. The application source is unchanged by this documentation and repository revision.

5 Requirements and test traceability

FR01 to FR22 retain their original identifiers and evidence groups. FR23 covers public landing and slider behaviour. FR24 covers administrator-controlled record preparation. NFR09 contains proposed workload and recovery targets for later measurement. The SRS and PRD contain the requirement-to-evidence mappings.

Acceptance activity	Method and result field	Owner
Hosted MySQL and HTTPS	Repeat complete citizen and staff journeys on staging. Record build, date and result.	Aminu and John
Security and permissions	Verify negative direct access, session, upload and private-path scenarios. Record defects.	Aminu; Bolaji reviews
Performance	Measure 95th percentile response time under 10 concurrent users and 10,000 stored requests. Compare with proposed 2.5-second target.	Aminu
Browser and accessibility	Desktop and mobile layout, keyboard focus, forms, reduced motion and print review.	John
Recovery	Restore a protected database, configuration and private-file backup into a separate instance. Record actual RPO and RTO.	Aminu
Human usability	Obtain consent, use anonymised participant IDs and record completion and assistance. Proposed success target is 8 of 10 participants.	Bolaji coordinates

Acceptance activity	Method and result field	Owner
Providers	Check the operator-configured SMTP inbox, SMS handset and live AI response separately.	Aminu

6 Reproduction and defect management

From the repository, run python3 src/tests/http_acceptance.py --php /path/to/php and repeat with --live. Run src/tests/installer_regression.py, src/tests/landing_demo_acceptance.py and node src/tests/carousel_interactions.cjs. The included repository CI defines the same checks for a suitable PHP environment.

Use a disposable empty database for test execution. Record a defect with the affected FR or NFR, expected and actual result, reproducible steps and evidence. A developer links the fix and a reviewer records the repeated result before closure. The repository contains issue and pull-request templates for this process.

7 Review and acceptance record
